Task 1

1. Design and develop visualizations and visual analytic tools that will allow Silas to explore and understand the profile of Sailor Shift's career

a. Who has she been most influenced by over time?

b. Who has she collaborated with and directly or indirectly influenced?

c. How has she influenced collaborators of the broader Oceanus Folk community?

Q'S

- **We don't change project proposal, right?**
- **[Task 1 — Sailor Shift Career Profile – Oceanus Folk: Then and Now]**

ALIAS

Who has she been most influenced by over time?

SCREENSHOT

- Influence type names were changed to improve readability
- Musical genres were sort in alphabetical order

This chart is a map of Sailor Shift's sources of inspiration across time. Each dot represents an influence relationship between one of Sailor's works (X-axis = release year) and its source of inspiration (Y-axis = musical genre). The color indicates the type of influence.
Sailor Shift's inspiration comes from a large sample of musical genres, 14 of them, ranging from Doom Metal to Synthwave and Indie Folk. From 2028, the year of her global breakthrough, influences diversified and intensified significantly. The dominant influence type is her getting inspired by the style of many genres, suggesting Sailor consistently reinterprets frameworks rather than copying existing works.
Undocumented inspirations are not reflected, which may underrepresent Sailor's musical influences.
The dataset does not directly link her works to specific artists as sources of inspiration, only to songs, albums, and musical groups.

While it is possible to trace the performers and composers behind those works, this yields 87 largely anonymous individuals with no clear way to identify the most influential artists. As a result, this visualization answers 'what genres' influenced Sailor rather than 'who specifically' influenced her.

Who has she collaborated with and directly or indirectly influenced?

- Collaboration type names were changed to improve readability
- Collaborations were sort in chronological order

- A filter to see only Ivy Echoes members has been added to the chart

This chart shows all her collaborations with other artists across her career timeline and the type of collaboration. Each row represents a collaborator, each square the year of the collaboration, and the colors distinguish the different types. Multiple squares on the same line indicate a recurring collaboration.
From 2024 to 2026, her circle is tight and centered around Ivy Echoes members (Maya Jensen, Jade Thompson, Lila "Lilly" Hartman, and Sophie Ramirez), reflecting her early band period. The band then broke up, and she had a solo breakthrough year in 2028. From now on, an entirely new wave of collaborators emerges, growing and changing through the years. This suggests that Sailor's rise attracted a more diverse network of collaborators, transitioning her from a band artist to a cooperative one.
The dataset only captures formal creative credits (composer, lyricist, performer), limiting the non-formal reality of collaborations across the music environment.

- Singers/groups were sort by descending order

This visualization identifies who Sailor has influenced. Each bar represents someone who referenced Sailor's work, and the color distinguishes between direct influence (the entity referenced Sailor herself or her work) and indirect influence (the entity referenced Ivy Echoes or Sailor's collaborators). The X-axis represents the number of times that each artist was linked to Sailor (documented).
Sailor Shift's influence reaches 27 distinct entities from a wide range of genres including Oceanus Folk, Indie Rock, Jazz, and Surf Rock. The first four entities show both direct and indirect influences, suggesting that they are the most involved in Sailor's artistic circle. The vast majority were influenced indirectly, highlighting that Sailor's impact on the music world propagates mainly through her collaborative network rather than through direct artistic borrowing.
The scale of influence is limited to what is formally documented, many other artists around the world could have been influenced by her without expressing it directly.

How has she influenced collaborators of the broader Oceanus Folk community?

- Work ID's measure was changed into ''count distinct'' to count the number of Oceanus Folk works.
- A reference line was added on the year 2028 to properly show when her breakthrough happened

This chart tracks the volume of Oceanus Folk work produced annually within Sailor Shift's circle. The vertical line marks 2028, the year of her breakthrough, and the colors distinguish three eras: before breakthrough, breakthrough year, and after breakthrough. Each bar represents the number of distinct Oceanus Folk works released each year.

The data tells a story of exponential growth. Before 2028, Oceanus Folk production was small and irregular, rarely exceeding 2 works per year. During the breakthrough year, production immediately jumps to 7 works, nearly doubling the previous year's result. Post-2028, the number of works went up and peaked at 12 works in 2030, consistently remaining between 3 and 8 works per year. This pattern suggests that Sailor's rise made her collaborators produce more Oceanus Folk music, creating a renaissance of the genre.

The broader Oceanus Folk community outside her immediate circle is not included, meaning that the full impact is likely to be greater than what is shown here.

- Work ID's measure was turned into ''Count'' to have the total number of works
- The visualization filters by only showing After Breakthrough Era
- Descending sorting to show the most important contributors first
- ''Is Ivy Member'' field was converted to discrete to allow the binomial variable to be rightly shown

This visualization complements the first one by ranking all Sailor's related artists who produced 3 or more Oceanus Folk works after her breakthrough. Each bar represents an artist, and its length shows the total number of works they produced. The color distinguishes Ivy Echoes members from the other collaborators. Only the artists with at least 3 works are shown on the graph, unless they are Ivy members. We can see that her former bandmates are among the least productive contributors, with only 2 works each. In contrast, new collaborators such as Beatrice Albright, Daniel O'Connell, and The Brine Choir lead the chart with 7 works each. This suggests that her influence on the Oceanus Folk community operated by attracting new artists rather than reactivating her original bandmates. The chart indicates that Sailor's breakthrough created a wave of Oceanus Folk creativity beyond her founding circle.

The true community-wide impact is likely larger than what is shown since the visualization only includes artists directly connected to Sailor through some collaboration.

Task 2

Task 2 — Full Documentation
Oceanus Folk: Genre Influence Analysis

PART 1: HOW IT WAS CREATED

---

1. Data Preparation

1.1 Source Files Used
The analysis is built on four CSV files derived from the MC1 knowledge graph using a Python preprocessing pipeline:

File	Description	Rows
`task2_genre_summary.csv`	Aggregated connection counts between genre pairs, with direction (inbound/outbound) and edge type	117
`task2_of_influence_out.csv`	Song-level edges where Oceanus Folk works reference works in other genres	371
`task2_of_influence_in.csv`	Song-level edges where works from other genres reference Oceanus Folk works	377
`task2_top_artists_influenced.csv`	Artist-level aggregation of top 30 artists most influenced by Oceanus Folk	30

1.2 Generating task2_top_artists_influenced.csv
This file was generated using a Python script operating on `lookup_nodes_clean.csv` and `lookup_edges_clean.csv`. The script:
1. Identified all Oceanus Folk song and album node IDs
2. Found all songs/albums from other genres that referenced Oceanus Folk works via InStyleOf, CoverOf, DirectlySamples, InterpolatesFrom or LyricalReferenceTo edges
3. Traced the PerformerOf edges to find the artist behind each influenced song
4. Aggregated the count of influenced works per artist
5. Assigned each artist a primary genre based on whichever genre appeared most frequently in their influenced works
6. Exported the top 30 artists with fields: artist_name, influenced_works_count, notable_works_count, primary_genre

```python
# Key logic excerpt
influence_types = {'InStyleOf', 'CoverOf', 'DirectlySamples', 'InterpolatesFrom', 'LyricalReferenceTo'}

# Step 1: Find influenced songs
for edge in edges:
    if edge['edge_type'] in influence_types and edge['target_id'] in of_ids:
        src = nodes.get(edge['source_id'], {})
        if src.get('genre') != 'Oceanus Folk':
```

```
        influenced_song_ids.add(edge['source_id'])

# Step 2: Find performers
for edge in edges:
    if edge['edge_type'] == 'PerformerOf' and edge['target_id'] in influenced_song_ids:
        performer = nodes.get(edge['source_id'], {})
        artist_data[performer['name']]['count'] += 1
```

1.3 Loading Data into Tableau
All four CSV files were loaded into a single Tableau workbook as separate connections. No joins or unions were performed between files to avoid row multiplication and direction mixing. Each sheet uses only one file at a time.

2. Creating the Sheets

Sheet 1 — Genres Most Influenced by Oceanus Folk
Data source: `task2_genre_summary.csv`

1. Dragged **Target Genre** → Rows shelf
2. Dragged **Connection Count** → Columns shelf (auto-aggregated as SUM)
3. Dragged **Direction** → Filters shelf → selected **outbound** only → clicked OK
4. Dragged **Target Genre** → Filters shelf → unchecked **Oceanus Folk** → clicked OK
5. Dragged **Edge Type** → Color in the Marks card
6. Clicked the sort descending button on the toolbar
7. Changed mark type dropdown from Automatic to **Bar**
8. Double-clicked the chart title → renamed to *"Genres Most Influenced by Oceanus Folk"*

Sheet 2 — Genres That Inspire Oceanus Folk
Data source: `task2_genre_summary.csv`

1. Created a new sheet by clicking **+** at the bottom
2. Dragged **Source Genre** → Rows shelf
3. Dragged **Connection Count** → Columns shelf (SUM)
4. Dragged **Direction** → Filters shelf → selected **inbound** only → clicked OK
5. Dragged **Source Genre** → Filters shelf → unchecked **Oceanus Folk** → clicked OK
6. Dragged **Edge Type** → Color in the Marks card
7. Clicked sort descending on the toolbar
8. Changed mark type to **Bar**
9. Renamed title to *"Genres That Inspire Oceanus Folk"*

Sheet 3 — Oceanus Folk Outward Influence Over Time
Data source: `task2_of_influence_out.csv`

1. Created a new sheet
2. In the Data pane, right-clicked **Source Release Date** → **Change Data Type → String**
3. Dragged **Source Release Date** → Columns shelf
4. Dragged **Source Name** → Rows shelf
5. Right-clicked **Source Name** pill in Rows → **Measure → Count**
6. Changed mark type dropdown to **Line**
7. Dragged **Target Genre** → Filters shelf → unchecked **Oceanus Folk** → clicked OK
8. Right-clicked the Y axis → **Edit Axis** → renamed to *"Number of Influence Connections"*
9. Right-clicked the **2023 data point** on the line → **Annotate → Point** → typed *"Sailor joins Ivy Echoes"*
10. Right-clicked the **2028 data point** → **Annotate → Point** → typed *"Sailor's global breakthrough"*
11. Renamed title to *"Oceanus Folk Outward Influence Over Time"*

Sheet 4 — Other Genres Drawing from Oceanus Folk Over Time
Data source: `task2_of_influence_in.csv`

1. Created a new sheet
2. Clicked **Data Source** tab → changed **Source Release Date** data type to **String**
3. Dragged **Source Release Date** → Columns shelf
4. Dragged **Source Name** → Rows shelf → right-clicked → **Measure → Count**
5. Changed mark type to **Line**
6. Dragged **Source Genre** → Filters shelf → unchecked **Oceanus Folk** → clicked OK
7. Right-clicked Y axis → **Edit Axis** → renamed to *"Number of Influence Connections"*
8. Added point annotations on 2023 (*"Sailor joins Ivy Echoes"*) and 2028 (*"Sailor's global breakthrough"*)
9. Renamed title to *"Other Genres Drawing from Oceanus Folk Over Time"*

Sheet 5 — Top Artists Influenced by Oceanus Folk
Data source: `task2_top_artists_influenced.csv`

1. Added `task2_top_artists_influenced.csv` as a new data source
2. Created a new sheet using this source
3. Dragged **Artist Name** → Rows shelf
4. Dragged **Influenced Works Count** → Columns shelf (SUM)
5. Changed mark type to **Bar**
6. Dragged **Primary Genre** → Color in the Marks card
7. Right-clicked **Artist Name** in Rows → **Filter → Top → By field → Top 15 → Influenced Works Count → Sum** → clicked OK
8. Clicked sort descending on the toolbar
9. Renamed title to *"Top Artists Influenced by Oceanus Folk"*

---

3. Creating the Sankey Diagram

Tool: Python 3.12, Plotly library
Data source: `task2_genre_summary.csv`

3.1 Installing Required Libraries
Run the following in Terminal before running the script:
```bash
pip3.12 install plotly pandas kaleido
```

3.2 Running the Script
1. Placed `sankey_genre_flow.py` and `task2_genre_summary.csv` in the same folder
2. Opened `sankey_genre_flow.py` in IDLE
3. Pressed **F5** to run
4. The script automatically opened the interactive chart in the browser
5. Two output files were saved: `sankey_genre_flow.html` and `sankey_genre_flow.png`

3.3 Script Logic Summary
1. Loaded and filtered `task2_genre_summary.csv` — removed internal Oceanus Folk flows and connections with fewer than 3 occurrences
2. Created two virtual anchor nodes: *"Oceanus Folk → Outward"* (left, blue) and *"Inward → Oceanus Folk"* (right, purple)
3. Built source/target/value arrays for both outbound and inbound flows
4. Assigned node colors — orange for bidirectional genres, light blue for outbound-only, red for inbound-only
5. Added semi-transparent link colors matching each source node
6. Added a two-line reading guide annotation at the bottom of the chart
7. Exported as interactive HTML and static PNG

---

4. Creating the Dashboards

Dashboard 1 — Oceanus Folk: Genre Influence Flow
1. Clicked the **dashboard icon (+)** at the bottom of Tableau
2. Went to **Dashboard → Show Title** → double-clicked to rename *"Oceanus Folk: Genre Influence Flow"*
3. Set size to **Fixed → 1200 x 800**
4. Dragged **Sheet 1** onto the left half of the canvas
5. Dragged **Sheet 2** onto the right half of the canvas
6. Resized both sheets to equal width by dragging the border between them

Dashboard 2 — Oceanus Folk: Influence Through Time
1. Created a new dashboard
2. Renamed title to *"Oceanus Folk: Influence Through Time"*

3. Dragged **Sheet 3** onto the top half of the canvas
4. Dragged **Sheet 4** onto the bottom half of the canvas
5. Resized both sheets to equal height

Dashboard 3 — Oceanus Folk: Top Influenced Artists
1. Created a new dashboard
2. Renamed title to *"Oceanus Folk: Top Influenced Artists"*
3. Dragged **Sheet 5** onto the canvas
4. Expanded to fill the full canvas

PART 2: USER GUIDE

How to Use Dashboard 1 — Oceanus Folk: Genre Influence Flow

This dashboard shows which genres Oceanus Folk most influenced (left chart) and which genres most inspired Oceanus Folk (right chart).

Left Chart — Genres Most Influenced by Oceanus Folk
What you see: A horizontal stacked bar chart showing target genres ranked by total connection count. Each color segment represents a different type of musical influence.

How to use it:
- **Read the bar length** — longer bar = stronger influence from Oceanus Folk on that genre
- **Read the colors** — each segment shows how the influence was expressed:
  - 🟦 **CoverOf** — Oceanus Folk songs were covered by this genre
  - 🟧 **DirectlySamples** — Oceanus Folk audio was directly sampled
  - 🟥 **InStyleOf** — works were created in the style of Oceanus Folk
  - 💙 **InterpolatesFrom** — melodies were borrowed from Oceanus Folk
  - 🟩 **LyricalReferenceTo** — lyrics referenced Oceanus Folk works
- **Hover over any bar segment** to see the exact connection count for that edge type and genre
- **The genres are sorted** from most to least influenced — Indie Folk at the top is the most influenced genre

Right Chart — Genres That Inspire Oceanus Folk
What you see: Same chart structure but showing which genres feed INTO Oceanus Folk.

How to use it:
- Same color coding and interaction as the left chart
- **Compare left vs right** — if a genre appears prominently on both sides it means there is a two-way musical exchange with Oceanus Folk

- **Desert Rock, Dream Pop and Indie Folk** appearing on both sides confirms they have a bidirectional relationship with Oceanus Folk

---

How to Use Dashboard 2 — Oceanus Folk: Influence Through Time

This dashboard shows how Oceanus Folk's influence evolved over time — both outward and inward.

Top Chart — Oceanus Folk Outward Influence Over Time
What you see: A line chart where each point represents the number of influence connections made by Oceanus Folk works in that year.

How to use it:
- **Read the peaks** — higher points mean more Oceanus Folk works were influencing other genres that year
- **Read the annotations** — two key events are marked directly on the chart:
  - *"Sailor joins Ivy Echoes"* (2023) — marks the dramatic spike in outward influence
  - *"Sailor's global breakthrough"* (2028) — marks the second wave of sustained influence
- **Hover over any data point** to see the exact year and connection count
- **The overall pattern** shows influence was low and scattered before 2020, then triggered by Sailor's career milestones

Bottom Chart — Other Genres Drawing from Oceanus Folk Over Time
What you see: Same structure but showing when OTHER genres started drawing from Oceanus Folk.

How to use it:
- **Compare with the top chart** — the top chart shows when Oceanus Folk influenced others, the bottom shows when others started recognising and drawing back from Oceanus Folk
- **Note the start date difference** — the top chart starts from 2000 but the bottom starts from 2007, showing a 7-year lag before external genres began referencing Oceanus Folk
- **The 2028 peak** on the bottom chart is even more pronounced than on the top — confirming Sailor's breakthrough was the key trigger for external recognition

---

How to Use Dashboard 3 — Oceanus Folk: Top Influenced Artists

This dashboard shows which individual artists were most influenced by Oceanus Folk.

Chart — Top Artists Influenced by Oceanus Folk
What you see: A horizontal bar chart of the top 15 artists whose works were most influenced by Oceanus Folk, colored by their primary genre.

How to use it:

- **Read the bar length** — longer bar = more works influenced by Oceanus Folk
- **Read the colors** — each color represents the artist's primary genre:
  - Shows which genre communities were most receptive to Oceanus Folk's influence
- **Hover over any bar** to see the artist name, exact influenced works count and primary genre
- **The even bar lengths** — most artists have 2–3 influenced works — confirm that Oceanus Folk's impact was broadly distributed across many artists rather than concentrated on a few
- **Dream Pop and Desert Rock dominate** the top 15, consistent with the genre-level findings in Dashboard 1

How to Use the Sankey Diagram — Bidirectional Genre Influence Flow

Access: Open `sankey_genre_flow.html` in any web browser for the fully interactive version. A static image is available as `sankey_genre_flow.png`.

What you see: A flow diagram showing the two-way musical influence between Oceanus Folk and other genres simultaneously.

How to read it:
- **Left blue node** (*Oceanus Folk → Outward*) — represents Oceanus Folk sending influence to other genres
- **Right purple node** (*Inward → Oceanus Folk*) — represents other genres sending influence back to Oceanus Folk
- **Middle nodes** — individual genres positioned between the two anchor nodes
- **Band thickness** — thicker bands = stronger influence relationship
- **Orange nodes** — genres with two-way exchange (both receiving and giving influence)
- **Light blue nodes** — genres that only receive influence from Oceanus Folk
- **Red/pink nodes** — genres that only give influence to Oceanus Folk

How to interact with it:
- **Hover over any band** — a tooltip appears showing the exact genre name and connection count
- **Hover over any node** — shows the total flow volume through that genre
- **Click and drag any node** — repositions it on the canvas for easier reading of overlapping bands
- **The interactive HTML version** is recommended for exploration — the static PNG is suitable for the poster and report

---

Key Analytical Findings Summary

Question	Finding

Was influence gradual or intermittent?	Triggered — spiked dramatically in 2023 and 2028 aligned with Sailor's career milestones
Which genres were most influenced?	Indie Folk (~100 connections), followed by Synthwave, Dream Pop and Doom Metal
Which artists were most influenced?	Influence broadly distributed across 483 artists — no single dominant recipient
What inspires Oceanus Folk?	Desert Rock, Dream Pop, Indie Folk and Space Rock are the strongest inbound influences
Is the exchange bidirectional?	Yes — Indie Folk, Desert Rock, Dream Pop and Space Rock all show two-way exchange
When did external recognition begin?	2007 — seven years after Oceanus Folk began referencing other genres in 2000

Task 3

Task 3 — Rising Star Prediction

Data Preparation

Three CSV files were derived from the master `mc1_nodes.csv` and `mc1_edges.csv` files using a Python preprocessing script (`Data/preprocess_mc1.py`).

`task3_notable_works.csv` (1,973 rows) was constructed by filtering all nodes where `notable = True` and `notoriety_date` is not empty, then joining `PerformerOf` edges to resolve the performing artist for each charted work. This produces one row per (work, performer) pair, retaining `genre`, `release_date`, `notoriety_date`, and `performer_type`.

`task3_artist_notoriety.csv` (1,664 rows) aggregates the above to one row per artist, computing four summary metrics: `total_notable_works` (count of charted works), `first_notoriety_date` (earliest chart appearance), `latest_notoriety_date` (most recent chart appearance), and `years_active_span` (difference between earliest and latest `release_date` across all their works). A boolean flag `is_oceanus_folk_artist` is set to `True` if any of the artist's genres contain "Oceanus Folk". Of the 1,664 artists, 56 are flagged as Oceanus Folk artists, and 14 of those have two or more notable works.

`task3_of_candidates.csv` (84 rows) filters `task3_notable_works` to Oceanus Folk artists only and joins the four summary metrics from `task3_artist_notoriety`. This file contains one row per notable work per Oceanus Folk artist, enabling both work-level and artist-level analysis within the same Tableau data source.

Visualisation — Tableau

Six Tableau sheets were built across two data sources within a single workbook. Each sheet is connected to the source most appropriate for its level of analysis.

Sheet 1 — OF Artist Ranking uses `task3_artist_notoriety` as its data source, with `Performer Name` on Rows, `SUM(Total Notable Works)` on Columns, and two filters applied: `Is Oceanus Folk Artist = True` and `SUM(Total Notable Works) >= 2`. This produces a horizontal bar chart ranking all 14 Oceanus Folk artists with two or more charted works, sorted in descending order by total works. The chart establishes the candidate pool for rising star prediction: Orla Seabloom leads with 7 notable works, followed by Copper Canyon Ghosts (5), Daniel O'Connell (4), Beatrice Albright (4), and Ping Meng (4). The remaining nine artists each have exactly 2 notable works.

Sheet 2 — Genre Mix by Candidate uses `task3_of_candidates` as its data source, with `Artist Name` on Rows, `CNT(Work Name)`on Columns, and `Genre` on the Colour mark. A filter on `CNT(Work Name)` restricts the view to the top five candidates with the highest work

counts. This stacked bar chart reveals the genre composition of each candidate's notable output. All top candidates produce exclusively Oceanus Folk, with the exception of Ping Meng who has two Lo-Fi Electronica works and one Dream Pop work alongside a single Oceanus Folk work — identifying her as a genre-diverse outlier rather than a pure Oceanus Folk rising star.

Sheet 3 — Notoriety Timeline uses `task3_of_candidates` as its data source, with `Notoriety Date` on Columns (treated as a continuous dimension), `Artist Name` on Rows, `Artist Name` on the Colour mark, and `Work Name` on the Detail mark to plot one dot per notable work. A filter on `SUM(Total Notable Works) >= 2` retains the full 14-candidate pool. Rows are arranged so that artists with later career activity appear toward the top. This dot plot reveals the temporal distribution of each artist's chart appearances — distinguishing between artists who achieved notoriety in a concentrated burst (Orla Seabloom with all 7 works charting in 2029, Beatrice Albright with 4 works in 2031) and those whose careers span many years (Ping Meng from 2011 to 2028, Tao Yin from 2013 to 2029).

Sheet 4 — Three Artist Comparison uses `task3_of_candidates` as its data source, with `Notoriety Date` on Columns (continuous), `Artist Name` and `Work Name` on Rows, and `Artist Name` on the Colour mark. An `Artist Name` filter selects only the three predicted rising stars: Copper Canyon Ghosts, Beatrice Albright, and Orla Seabloom. This sheet provides a detailed work-by-work comparison of each prediction's career trajectory, showing the title and chart year of every notable work side by side.

Sheet 5 — Breakthrough Profile uses `task3_artist_notoriety` as its data source, with `Years Active Span` on Columns, `SUM(Total Notable Works)` on Rows, `Performer Name` on the Label mark, and a Circle mark type. Filters are `Is Oceanus Folk Artist = True`and `SUM(Total Notable Works) >= 2`. The x-axis begins at 0. This scatter plot positions each of the 14 candidates by how long they were active before charting (x-axis) against how many works they have charted (y-axis). Artists in the top-left region — high output with a short active span — represent the ideal rising star profile. Orla Seabloom occupies this position most strongly (7 works, 0-year span), while Ping Meng sits as an extreme outlier in the top-right (4 works, 17-year span), indicating a long and slow career rather than a rapid breakout.

Visualisation — Python Radar Chart

A radar chart was generated in Python using `matplotlib` (`Data/task3_radar.py`) to compare the top five Oceanus Folk candidates across five normalised dimensions simultaneously — a multi-axis comparison that cannot be achieved natively in Tableau.

The top five candidates by `total_notable_works` were selected from `task3_artist_notoriety`: Orla Seabloom (7), Copper Canyon Ghosts (5), Daniel O'Connell (4), Beatrice Albright (4), and Ping Meng (4).

Five metrics were defined and min–max normalised within this five-artist pool:

Metric	Field	Direction
Total Notable Works	`total_notable_works`	Higher = better
Quick Breakthrough	`years_active_span` (inverted)	Lower span = higher score
Early Breakthrough	`first_notoriety_date` (inverted)	Earlier year = higher score
Recent Activity	`latest_notoriety_date`	Later year = higher score
Genre Diversity	Count of unique genres in `genres` field	More genres = higher score

Normalisation was scoped to the five-candidate pool rather than the full dataset, so each radar axis represents relative standing among the top candidates. The chart was saved as a PNG at 150 dpi and embedded as a static image in the Tableau dashboard alongside a companion data table showing the raw values.

Dashboards

Dashboard 1 — "Who are the Candidates?" combines three sheets in a tiled layout: the OF Artist Ranking bar chart (top-left), the Genre Mix by Candidate stacked bar (top-right), and the Breakthrough Profile scatter plot (bottom, spanning full width). Together, these three views answer the question of which Oceanus Folk artists form the candidate pool and how they compare on output volume, genre focus, and breakthrough speed.

Dashboard 2 — "Who's Next?" combines the Three Artist Comparison dot plot (top-left), the Notoriety Timeline (bottom-left), and the radar chart image (right). This dashboard presents the final predictions. The Three Artist Comparison provides a detailed work-by-work timeline for the three predicted stars, the Notoriety Timeline provides broader context by showing all 14 candidates, and the radar chart synthesises the five key metrics into a single comparative profile for the top five.

Results and Discussion

What does it mean to be a rising star?

Based on the visualisations above, a rising star in the Oceanus Folk music scene is characterised by five attributes:

1. **High notable output** — the artist has multiple works that achieved chart notoriety, not just a single hit. Among the 56 Oceanus Folk artists in the dataset, only 14 produced two or more notable works, and the strongest candidates produced four or more.

2. **Rapid breakthrough** — the time between the artist's first release and their first chart appearance is short. Orla Seabloom and Beatrice Albright both have a years-active span of zero, meaning their works charted in the same year they were released. Copper Canyon Ghosts achieved a span of just one year. By contrast, Ping Meng's 17-year span and Tao Yin's 16-year span suggest established careers rather than breakout trajectories.
3. **Concentrated momentum** — rising stars tend to chart multiple works within a narrow time window rather than sporadically over many years. Orla Seabloom charted all 7 works in 2029; Beatrice Albright charted all 4 in 2031. This burst pattern signals a career inflection point — the hallmark of a rising star.
4. **Genre commitment** — the strongest Oceanus Folk candidates produce almost exclusively within the genre. Ping Meng, despite having 4 notable works, splits across Lo-Fi Electronica, Dream Pop, and Oceanus Folk — making her more of a genre-crossing veteran than a rising Oceanus Folk star.
5. **Recency** — artists whose chart activity is more recent are more likely to represent the next wave. Copper Canyon Ghosts' notoriety dates (2034–2035) are the most recent in the candidate pool, placing them at the frontier of the genre's evolution.

The Breakthrough Profile scatter plot captures attributes 1 and 2 directly: ideal candidates cluster in the top-left (high works, low span). The Notoriety Timeline captures attribute 3 visually through dot clustering. The Genre Mix chart captures attribute 4 through colour segmentation. The radar chart synthesises all five attributes into a single comparative shape — a larger, more balanced polygon indicates a stronger overall rising star profile.

Three Artist Comparison

The three artists selected for detailed comparison are Orla Seabloom, Beatrice Albright, and Copper Canyon Ghosts. Each represents a distinct breakout pattern:

Orla Seabloom had the most explosive debut in the candidate pool — all 7 of her notable works (*Beneath the Whispering Waves*, *Ebbing Heart*, *Riding the Moon's Reflection*, *Seasheel Lullaby*, *The Shifting Sands*, *The Song of Forgotten Shores*, and *Tidal Journey*) charted in a single year (2029). Her radar profile is the largest overall shape, dominating the Total Notable Works axis and scoring maximally on Quick Breakthrough. However, because all works charted in the same year, her Recent Activity score is moderate — her last chart appearance was 2029, earlier than the other two predictions.

Beatrice Albright followed a similar concentrated pattern, charting 4 works (*Moonlit Kelp Forest Dance*, *Seven Fathoms Deep*, *The Siren's Sigh*, *Whispers on the Jetty Wind*) in 2031, all in Oceanus Folk. Her years-active span is also zero, giving her a strong Quick Breakthrough score. Her profile closely mirrors Orla Seabloom's shape on the radar chart, albeit smaller due to fewer total works.

Copper Canyon Ghosts charted 5 works across 2034–2035 (*Canyon Echoes, Ocean Dreams*; *Crimson Cliffs Awakening*; *Salt-Stained Letters*; *Shadows in Smuggler's Cove*; *The Cartographer's Curse*), all in Oceanus Folk. With only a 1-year span and the most recent notoriety dates in the entire candidate pool, Copper Canyon Ghosts score highest on Recent

Activity. Their radar profile is the most balanced of the three, with strong scores across all axes except Early Breakthrough (since their career began later).

Predictions — Next Three Oceanus Folk Stars

Based on the rising star profile defined above, the three artists predicted to be the next Oceanus Folk breakout stars over the next five years are:

1. **Orla Seabloom** — With 7 notable works and an instant breakthrough in 2029, she has the highest volume and fastest rise of any Oceanus Folk candidate. Her concentrated output suggests an artist at the peak of a career inflection, and her exclusive focus on Oceanus Folk makes her the genre's most prolific emerging voice.
2. **Copper Canyon Ghosts** — Their 5 notable works between 2034 and 2035, combined with a 1-year active span and pure Oceanus Folk output, place them as the most recent breakout act in the candidate pool. Their recency gives them the strongest forward momentum heading into the next five years.
3. **Beatrice Albright** — With 4 works charting simultaneously in 2031 and zero years-active span, she demonstrates the same explosive breakout pattern as Orla Seabloom. Her exclusively Oceanus Folk catalogue and rapid rise make her a strong candidate to sustain chart presence in the coming years.

These three were chosen over Daniel O'Connell (who matches Beatrice Albright's numbers but shares the same 2031 burst, making them interchangeable on the available metrics) and Ping Meng (whose 17-year span and multi-genre output disqualify her from the rising star profile despite having 4 notable works).
